

Jahongir Hamidov

Full-Stack Developer — React / Next.js · Node.js · Python

imhamidovic@gmail.com | github.com/nyxeldev | linkedin.com/in/iamhamidov | nyxeldev.pro

SUMMARY

Front-end developer moving into full-stack. React and Next.js are where I started; I now build the services behind them — Node.js and Python APIs, PostgreSQL schema design, ETL pipelines over production data. Reverse-engineered the weekly settlement exports at an Amazon Relay carrier and specified the tooling that replaces the manual reconciliation. Studying Information Security Management.

TECHNICAL SKILLS

Front-End React, Next.js (App Router), TypeScript, JavaScript (ES6+), Tailwind CSS, shadcn/ui

Back-End Node.js, Fastify, FastAPI, Prisma ORM, REST APIs, WebSockets

Databases PostgreSQL, Redis, SQLite

Data & ML Python, Scikit-learn, Celery, ETL pipelines, SQL, feature engineering

Security RBAC, JWT (refresh rotation), TOTP 2FA, audit logging, rate limiting

DevOps & Testing Docker, GitHub Actions, Nginx, GHCR, Jest, Vitest, pytest, Playwright

PROJECTS

SEASMP — Education Analytics & Monitoring Platform

May 2026 – Present

Solo developer — github.com/nyxeldev/seasmp

- Four role-specific dashboards on one Next.js App Router codebase: route guards, role-conditional rendering and per-role fetching, so a student session never issues an admin query.
- QR attendance end to end — browser camera capture, a one-time Redis token (5-min TTL) verified against the JWT actor, optimistic UI that rolls back on server rejection.
- Hybrid back end: a Fastify core API plus a FastAPI analytics service over an internal HTTP contract. Chose synchronous calls over a broker given low inter-service volume, so an analytics outage degrades only /analytics routes.
- ETL and ML pipeline over production tables — 8 behavioral features, Random Forest with balanced class weights, nightly Celery re-scoring, monthly retrain promoted only when AUC beats the deployed model. The dataset is still small (191 enrollments, 6 dropout events), so the pipeline is validated end to end and re-validates as data grows.
- Found a class of silent failures: behind Nginx, request.ip resolved to the container address, breaking rate limiting, audit attribution and the unknown-IP anomaly signal at once — with every test still green.
- Security and CI: 4-role RBAC with service-level ownership checks, JWT refresh rotation, TOTP 2FA, a before/after audit log; 5 parallel CI jobs (Jest, Vitest, Postgres + Redis integration, pytest, Playwright) → Docker → GHCR.

EXPERIENCE

Internal Tooling & Data Analysis · MIM Logistics LLC, Tashkent

Jul 2025 – Present

Amazon Relay carrier — dispatch operations and the settlement data behind them

Settlement Data Analysis & Automation Spec — *internal initiative, 2026*

- Reverse-engineered Amazon Relay's undocumented settlement and trip exports: record structure, join keys, and the status semantics behind weekly driver payroll.
- The obvious aggregation is wrong. Each export ends with an invoice-total row that doubles gross pay, and nothing raises an error — the naive total came out at exactly 2× the real one.
- Payments arrive in two layers: TOUR rows carry base pay but no Load ID, LOAD rows carry fuel and tolls. Joining on Load ID alone silently drops 47% of the payout.
- Traced a 1-of-37 match rate to a date-range mismatch between the two files rather than unpaid loads; without that check the tool fires 36 false alerts every run.
- Validated payout logic for 4 compensation models against real payroll at zero variance, then specified the build around it: fixed-point decimals, compensation rules stored in the database rather than in code, tenant isolation at both the ORM and PostgreSQL RLS layer.

EDUCATION

International Islamic Academy of Uzbekistan — BSc, Information Security Management

2023 – Present

Najot Ta'lim — Tashkent — Front-End Development (ReactJS) bootcamp · ReactJS Certificate

Jul 2023 – May 2024

Also ICPC — National Round finalist · Uzbek (Native), English (Upper-Intermediate), Russian (Pre-Intermediate)
